Abstract of FR2767813

A method for the treatment of a glass panel consists of supporting an assembly for the glass panel (P1) formed from two glass plates on an evacuating chariot (20) placed inside a furnace (1). A sealing material is applied on the periphery of one of the opposed surfaces of the two glass plates and is provided with an evacuation tube connected to an evacuation system. The sealing of the two glass plates is carried out by heating the glass panel (P1) and fusing the sealing material during the displacement of the chariot (20) in the furnace whilst evacuating the air placed between the two plates of the panel (P1) and sealing and cutting the evacuation tube. An independent claim is also included for the apparatus used to put this method into service.
